

## 2021 Week 17

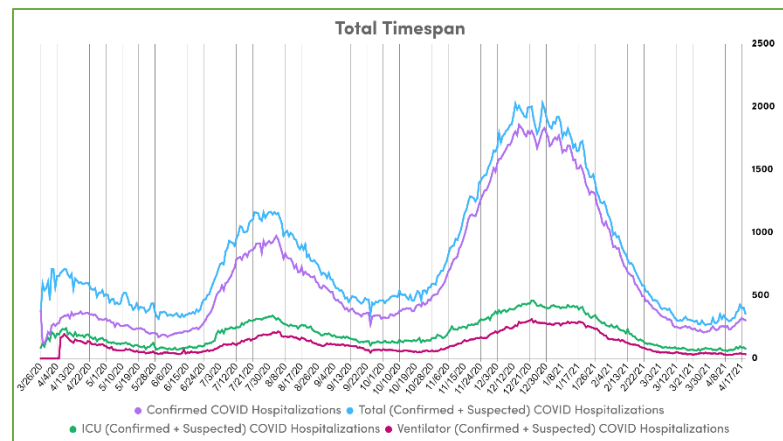

### State of Nevada Data Set

#### In this Issue:

Hospitalizations	1
Emergency Department	2
Hospital Relative Demand	2
Regional Charts	
North	3
South	4
Rural	4

**IMPORTANT:** If you need access to hospital data, you must register for NHISS portal access. Send an email request to [COVID@nvha.net](mailto:COVID@nvha.net)

The state is within ten days of turning control of public gatherings over to county authorities, and Nevada's COVID-19 hospitalizations remain manageable in all regions of the state.

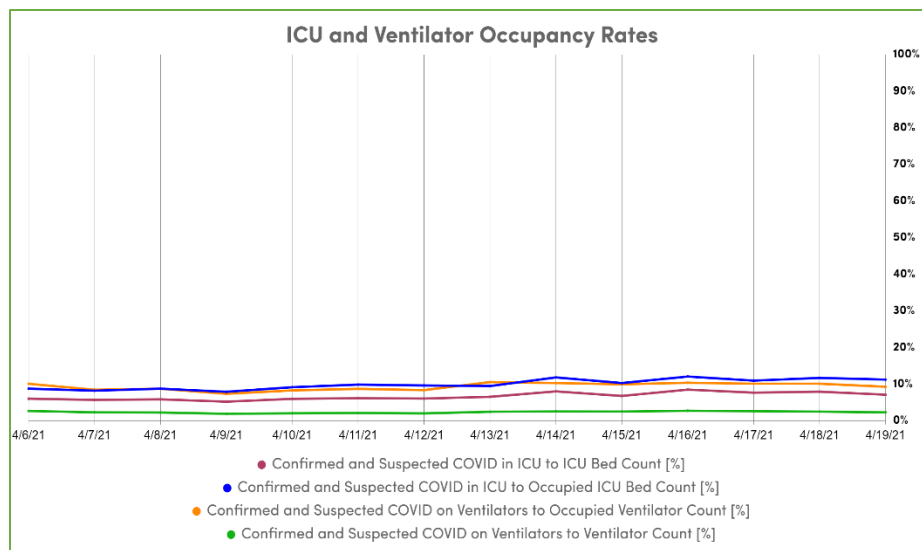

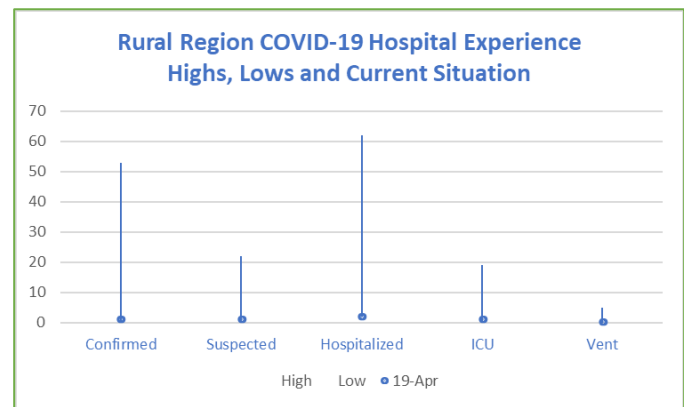

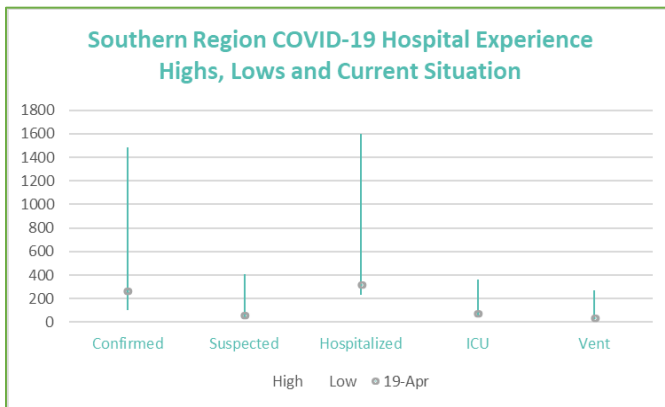

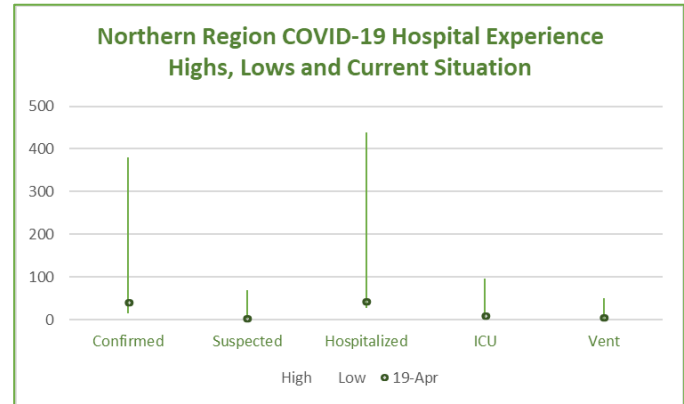

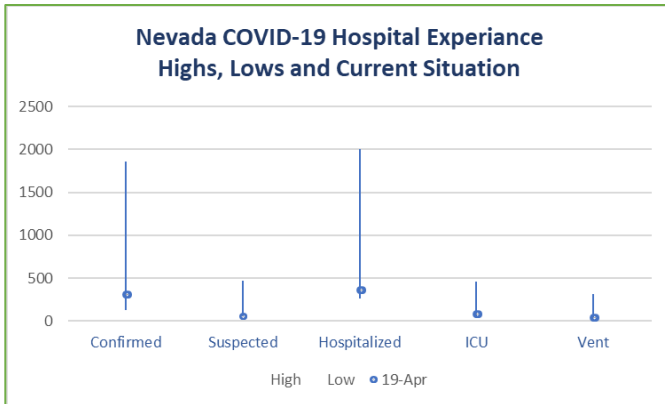

It is reasonable to anticipate significant increases in hospitalizations may occur as restrictions become lightened and events and activities begin to normalize. Increases in hospitalizations would not be unfathomable and could be appropriately managed within the Nevada hospital system.

The current situation is different than last summer. Hospitals have learned to adapt, treating thousands of COVID-19 patients. PPE and testing are now available, and Nevada has multiple effective vaccines.

#### As of April 20, 2021

Category	Nevada	North	South	Rural
Confirmed COVID-19	294	35	256	3
Suspected COVID-19	41	1	39	1
Hospitalized COVID-19	335	36	295	4
ICU Patients	78	9	68	1
Ventilator Required	34	5	29	0

Emergency Department (ED) visits for COVID-19-related symptoms remained stable for the seventh week at 8%.

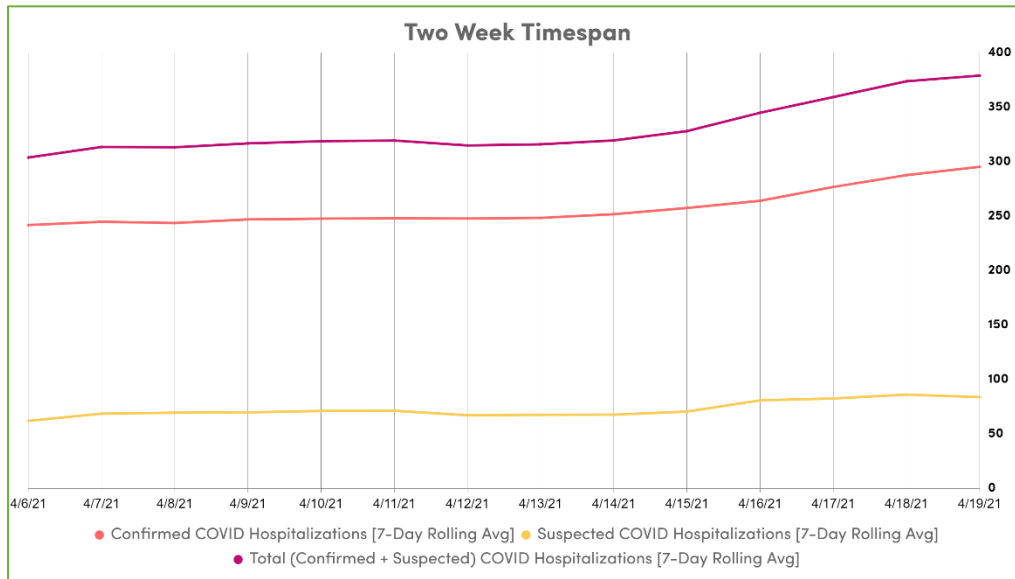

**Relative Demand:**  
COVID patients in ICU represent 7% of licensed beds and 11% of occupied ICU beds.

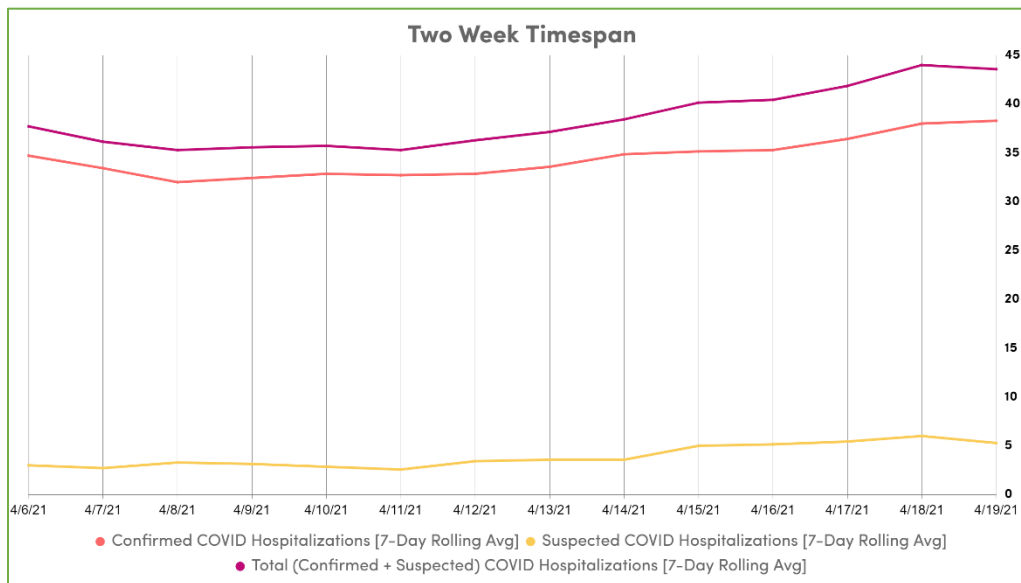

COVID patients requiring mechanical ventilation represent 9% of vents in use and 2% of available ventilators.

During the past 14-day period, COVID-19 hospitalization trends have been subtly climbing. Nevada hospitals however, have the capacity and capability to adequately care for these patients.
